This draft European Standard is submitted to CENELEC members for formal vote.  
Deadline for CENELEC: 2012-11-02.

It has been drawn up by CLC/TC 210.

If this draft becomes a European Standard, CENELEC members are bound to comply with the CEN/CENELEC Internal Regulations which stipulate the conditions for giving this European Standard the status of a national standard without any alteration.

This draft European Standard was established by CENELEC in three official versions (English, French, German). A version in any other language made by translation under the responsibility of a CENELEC member into its own language and notified to the CEN-CENELEC Management Centre has the same status as the official versions.

CENELEC members are the national electrotechnical committees of Austria, Belgium, Bulgaria, Croatia, Cyprus, the Czech Republic, Denmark, Estonia, Finland, Former Yugoslav Republic of Macedonia, France, Germany, Greece, Hungary, Iceland, Ireland, Italy, Latvia, Lithuania, Luxembourg, Malta, the Netherlands, Norway, Poland, Portugal, Romania, Slovakia, Slovenia, Spain, Sweden, Switzerland, Turkey and the United Kingdom.

Recipients of this draft are invited to submit, with their comments, notification of any relevant patent rights of which they are aware and to provide supporting documentation.

Warning : This document is not a European Standard. It is distributed for review and comments. It is subject to change without notice and shall not be referred to as a European Standard.

46 **Foreword**

47 This document (FprEN 50561-1:2012) has been prepared by CLC/TC 210, "Electromagnetic compatibility  
48 (EMC)".

49 This document is currently submitted to the Formal Vote.

50 The following dates are proposed:

- latest date by which the existence of this document has to be announced at national level (doa) dor + 6 months
- latest date by which this document has to be implemented at national level by publication of an identical national standard or by endorsement (dop) dor + 12 months
- latest date by which the national standards conflicting with this document have to be withdrawn (dow) dor + 36 months (to be confirmed or modified when voting)

51

52 This document has been prepared under a mandate given to CENELEC by the European Commission and  
53 the European Free Trade Association, and supports essential requirements of EU Directive(s).

54 For the relationship with EU Directive(s) see informative Annex ZZ, which is an integral part of this  
55 document.

56 The scope is extended to the whole radio-frequency range from 9 kHz to 400 GHz, but limits are formulated  
57 only in restricted frequency bands, which are considered sufficient to reach adequate emission levels to  
58 protect radio broadcast and telecommunication services and to allow other apparatus to operate as intended  
59 at reasonable distance.

60 **Introduction**

61 The European Committee for Electrotechnical Standardization (CENELEC) draws attention to the fact that it  
62 is claimed that compliance with this document may involve the use of a patent given in FprEN 50561-1:2012.

63 CENELEC takes no position concerning the evidence, validity and scope of this patent right.

64 The holder of this patent right has assured CENELEC that he is willing to negotiate licenses under  
65 reasonable and non-discriminatory terms and conditions with applicants throughout the world. In this respect,  
66 the statement of the holder of this patent right is registered with CENELEC. Information may be obtained  
67 from:

68 Sony Cooperation  
69 Hiroshi Kamitani  
70 IP Alliance & Licensing Department  
71 1-7-1 Konan, Minato-ku, Tokyo 108-0075, Japan  
72 Tel: +81-3-6748-3505  
73 Fax: +81-6748-3544  
74 Hiroshi.Kamitani@jp.sony.com

75 Attention is drawn to the possibility that some of the elements of this document may be the subject of patent  
76 rights other than those identified above. CENELEC shall not be held responsible for identifying any or all  
77 such patent rights

78 **1 Scope**

79 This part of EN 50561 specifies limits and methods of measurement of radio disturbance characteristics for  
80 in-home communication apparatus that use the low-voltage power installation as the transmission medium.  
81 This part of EN 50561 applies to equipment that communicate over this medium in the frequency range  
82 1,606 5 MHz to 30 MHz.

83 NOTE Similar equipment that communicate outside this frequency range is under study and will be covered by  
84 another European Standard.

85 Procedures are given for the measurement of signals generated by the equipment and limits are specified for  
86 the frequency range 9 kHz to 400 GHz. No measurement is required at frequencies where no limit is  
87 specified.

88 **2 Normative references**

89 The following documents, in whole or in part, are normatively referenced in this document and are  
90 indispensable for its application. For dated references, only the edition cited applies. For undated references,  
91 the latest edition of the referenced document (including any amendments) applies.

92 EN 55022:2010 + AC:2011, *Information technology equipment — Radio disturbance characteristics — Limits*  
93 *and methods of measurement (CISPR 22:2008, modified)*

94 EN 55016-1-1:2010, *Specification for radio disturbance and immunity measuring apparatus and methods —*  
95 *Part 1-1: Radio disturbance and immunity measuring apparatus — Measuring apparatus*  
96 *(CISPR 16-1-1:2010 + corrigendum Oct. 2011)*

97 EN 55016-1-2:2004, *Specification for radio disturbance and immunity measuring apparatus and methods —*  
98 *Part 1-2: Radio disturbance and immunity measuring apparatus — Ancillary equipment — Conducted*  
99 *disturbances (CISPR 16-1-2:2003)*

100 EN 55016-4-2:2004<sup>1)</sup>, *Specification for radio disturbance and immunity measuring apparatus and*  
101 *methods — Part 4-2: Uncertainties, statistics and limit modelling — Uncertainty in EMC measurements*

106 *purposes*

107 ITU-R Recommendation BS.1615<sup>3)</sup>, *"Planning parameters" for digital sound broadcasting at frequencies*  
108 *below 30 MHz*

---

1) EN 55016-4-2:2004 will be superseded by EN 55016-4-2:2011, *Specification for radio disturbance and immunity measuring apparatus and methods — Part 4-2: Uncertainties, statistics and limit modelling — Measurement instrumentation uncertainty (CISPR 16-4-2:2011)*

2) BS.560-3 is superseded by BS.560-4, *Radio-frequency protection ratios in LF, MF and HF broadcasting*

3) BS.1615 is superseded by BS.1615-1, *"Planning parameters" for digital sound broadcasting at frequencies below 30 MHz*

## 109 **3 Terms and definitions**

110 For the purposes of this document, the following terms and definitions apply.

### 111 **3.1**

#### 112 **AC mains power port**

113 port that connects to the low voltage AC mains power network for the sole purpose of supplying electrical  
114 energy to the EUT

### 115 **3.2**

#### 116 **AC mains output port**

117 port of the EUT that provides AC mains power to other apparatus

### 118 **3.3**

#### 119 **Artificial Mains Network**

##### 120 **AMN**

121 network providing a defined impedance at high frequencies across the power feed at the point of  
122 measurement of the terminal voltage, and also providing isolation of the circuit under test from the ambient  
123 noise on the power lines

124 Note 1 to entry: Such a network with a nominal impedance of  $50 \Omega/50 \mu\text{H}$  or  $50 \Omega/50 \mu\text{H} + 5 \Omega$  is defined in  
125 EN 55016-1-2:2004, 4.3.

### 126 **3.4**

#### 127 **Associated Equipment**

##### 128 **AE**

129 equipment needed to maintain the data traffic on the cable attached to the EUT port under test and (or) to  
130 maintain the normal operation of the EUT during the test

131 Note 1 to entry: The AE can be another ITE, a traffic simulator or a connection to a network. The AE can be situated  
132 close to the measurement set-up, outside the measurement room or be represented by the connection to a network. The  
133 AE may be physically located outside the test area. The AE should not have any appreciable influence on the test  
134 results.

### 135 **3.5**

#### 136 **Equipment Under Test**

##### 137 **EUT**

138 representative equipment used for evaluation purposes

### 139 **3.6**

#### 140 **Impedance Stabilisation Network**

##### 141 **ISN**

142 symmetrical network for the measurement of the launched common mode disturbance signal transmitted by  
143 the EUT

### 144 **3.7**

#### 145 **in-Home PLC apparatus**

146 PLC apparatus that connects to the low voltage AC mains power network and intended to be linked to other  
147 PLC apparatus connected in the same home

148 **3.8**  
149 **Information Technology Equipment**  
150 **ITE**  
151 any equipment:

- 152 a) which has a primary function of either (or a combination of) entry, storage, display, retrieval,  
153 transmission, processing, switching, or control, of data and of telecommunication messages and which  
154 may be equipped with one or more terminal ports typically operated for the transfer of information,
- 155 b) with a rated supply voltage not exceeding 600 V

156 Note 1 to entry: ITE includes, for example, data processing equipment, office machines, electronic business equipment  
157 and telecommunication equipment.

158 Note 2 to entry: Any equipment (or part of the ITE equipment) which has a primary function of radio transmission  
159 and/or reception according to the ITU Radio Regulations is excluded from the scope of this European Standard.

160 Note 3 to entry: Any equipment which has a function of radio transmission and/or reception according to the definitions  
161 of the ITU Radio Regulations should fulfil the national radio regulations, whether or not this European Standard is also  
162 valid.

163 **3.9**  
164 **PLC apparatus**  
165 apparatus with a PLC port

166 Note 1 to entry: PLC apparatus are also called PLT apparatus.

167 **3.10**  
168 **PLC port**  
169 port that connects to the low voltage AC mains power network for the purpose of data transfer and  
170 communication, and may also supply electrical energy to the EUT

171 Note 1 to entry: PLC ports are also called PLT ports.

172 **3.11**  
173 **telecommunications/network port**  
174 point of connection for voice, data and signalling transfers intended to interconnect widely-dispersed systems  
175 via such means as direct connection to multi-user telecommunications networks (e.g. public switched  
176 telecommunications networks (PSTN) integrated services digital networks (ISDN), x-type digital subscriber  
177 lines (xDSL), etc.), local area networks (e.g. Ethernet, Token Ring, etc.) and similar networks

178 Note 1 to entry: A port generally intended for interconnection of components of an ITE system under test (e.g. RS-232,  
179 IEEE Standard 1284 (parallel printer), Universal Serial Bus (USB), IEEE Standard 1394 ("Fire Wire"), etc.) and used in  
180 accordance with its functional specifications (e.g. for the maximum length of cable connected to it), is not considered to  
181 be a telecommunications/network port under this definition.

182 Note 2 to entry: A PLC port is not considered a telecommunications network port in the sense of Definition 3.11.

183 **3.12**  
184 **user data**  
185 data originated from or destined to another device

186 **3.13**  
187 **'valid' radio broadcast service**  
188 radio broadcast service for which the field strength of the wanted radio signal at the location of the radio  
189 broadcast receiver is either at or above the minimum usable field strength level of 40 dB( $\mu$ V/m) as defined by  
190 the ITU Radio Regulations and ITU-R Recommendation BS.703

#### 191 **4 Requirement for conducted disturbances at AC mains power ports**

192 The AC mains power ports of the EUT shall comply with the Class B limits, using the measurement  
193 conditions and the methodology defined in EN 55022 for mains terminals.

#### 194 **5 Requirement for conducted disturbances at telecommunication/network ports**

195 The Telecommunications/network ports of the EUT shall comply with the Class B limits, using the  
196 measurement conditions and the methodology defined in EN 55022 for these ports.

### 197 **6 Requirements for conducted disturbances and communications signals at PLC** 198 **ports**

#### 199 **6.1 General requirements**

200 The PLC port of the EUT shall comply with the following requirements:

201 In any operating condition, the unsymmetrical disturbances from the PLC port shall not exceed the  
202 disturbance limits given in Table 1 between 150 kHz and 1,606 5 MHz using the methods and procedures  
203 given in 9.1.

204 When user data is being transmitted by the PLC port the disturbances from the PLC port may exceed the  
205 disturbance limits of Table 1 at frequencies between 1,606 5 MHz and 30 MHz provided that within

206 — all the excluded frequency ranges given in Table A.1, the level of the transmitted signals shall comply  
207 with the disturbance limits given in Table 1 using the methods and procedures given in 9.1,

208 — all the excluded frequency ranges given in Table A.2, the level of the transmitted signals shall comply

209     ○ either with the disturbance limits given in Table 1 using the methods and procedures given in 9.1,

210     ○ or with the dynamic frequency exclusion requirements given in 6.2.

211 Without user data transmission, the unsymmetrical disturbances from the PLC port shall comply with the  
212 disturbance limits given in Table 1 between 150 kHz and 30 MHz using the methods and procedures given  
213 in 9.1.

214 The maximum transmitted signal from the PLC port shall not exceed the maximum values given in Table 2  
215 measured using the methods and procedures given in 9.2.

216 The PLC port shall implement a dynamic power control function for the purpose of minimising the probability  
217 of radio disturbance whilst still maintaining communication. The dynamic power control function shall be  
218 capable of reducing the output power to the maximum levels given in Table 2 measured using the methods  
219 and procedures given in 9.2.

220 In order to ensure the inherent symmetry of the PLC port it shall, in all operating conditions, comply with the  
221 disturbance limits given in Table 1 using the methods and procedures given in 9.4.

222

**Table 1 — Limits for conducted disturbances**

| Frequency range<br>MHz | Limits<br>dB( $\mu$ V) |          |
|------------------------|------------------------|----------|
|                        | Quasi-peak             | Average  |
| 0,15 to 0,50           | 66 to 56               | 56 to 46 |
| 0,50 to 5              | 56                     | 46       |
| 5 to 30                | 60                     | 50       |

NOTE 1 The lower limit applies at the transition frequencies.  
NOTE 2 The limit decreases linearly with the logarithm of the frequency in the range 0,15 MHz to 0,50 MHz.

223

224

**Table 2 — Maximum PLC transmit signal level between 1,606 5 MHz and 30 MHz**

|  |    |    |           |
|--|----|----|-----------|
| <b>Symmetrical mode insertion loss EUT to AE in dB</b>             | 10 | 20 | $\geq 40$ |
| <b>Maximum transmit signal level in dB(<math>\mu</math>V) (AV)</b> | 65 | 75 | 95        |
| <b>Maximum transmit signal level in dB(<math>\mu</math>V) (PK)</b> | 75 | 85 | 105       |

NOTE The transmit power management function of an AE should operate in the same way as the EUT otherwise the signal of the AE may dominate and cause erroneous results during measurement.

225

226

**6.2 Specific requirements for dynamic frequency exclusion**

227

228

229

Within 15 s of a 'valid' HF radio broadcast service being present within the excluded frequency band given in Table A.2, the transmitted PLC signal level shall not exceed a symmetrical voltage level of 56 dB( $\mu$ V) (AV) in a 9 kHz resolution bandwidth.

230

231

NOTE 1 This level of the symmetrical voltage is derived from the EN 55022 Mains Conducted Class B disturbance limit (5 MHz to 30 MHz), which is  $U_{AMN} = 50$  dB( $\mu$ V) (Resolution Bandwidth 9 kHz, AV).

232

233

234

235

236

The transmitted PLC signal shall avoid using the frequency of an identified radio broadcast service. The minimum width of the excluded frequency band shall be 10 kHz ( $\pm 5$  kHz centred on the carrier frequency of the broadcast signal). The excluded frequency band shall also comply with the requirements of Figure 1 in order to avoid adjacent channel interference, with respect to AM / DRM protection ratios as defined in ITU-R Recommendations BS.560-3, BS.1615 and BS.703, from transmissions outside the notch.

237

238

239

If several neighbouring radio broadcast services are identified or a digital (DRM) service occupying more than a single conventional channel, the width of the excluded frequency range shall be increased, scaled to integer multiples of 5 kHz.

240

241

NOTE 2 Usually, the channels of radio broadcast services are allocated with a minimum spacing of 5 kHz. Also, the centre frequency is a multiple of 5 kHz.

242

243

244

The excluded frequency band shall remain excluded continuously for the entire duration that the 'valid' radio broadcast service is present. After the detection of a 'valid' radio broadcast service has ceased, the excluded frequency band shall remain excluded for at least 3 additional minutes.

245

246 where

247 width  $\geq 10$  kHz, lower level = 56 dB( $\mu$ V) (AV, Resolution bandwidth 9 kHz) and

|        | Width increment on each side of the excluded frequency range kHz | Maximum level above the lower level of the notch ( $A(x)$ ) dB |
|--------|--|--|
| Step a | 2  | 0  |
| Step b | 10   | $\leq 25$  |
| Step c | 20   | $\leq 35$  |

248

**Figure 1 — Minimum requirements for a dynamically excluded frequency range**

249

## 7 Requirement for radiated disturbances

250 The EUT shall comply with the Class B limits, using the measurement conditions and the methodology  
251 defined in EN 55022 for radiated disturbances.

252

## 8 Measurement conditions for PLC ports

253

The measurement of PLC ports shall be performed in conformance with EN 55022:2010, Clause 8.

254 The tests requiring the PLC modem function to be active shall be performed with the condition of PLC  
255 utilisation in excess of 10 % and with the transmit signal set at its maximum level maintained for a minimum  
256 of 250 ms. As an example, the transmission of a large data file could be used to exercise the port. Where  
257 this is not possible an appropriate configuration should be used that ensures the PLC transmission is active  
258 for a period of time long enough to allow for repeatable measurements in this state.

259 < Note to the NC's (not to be included in final standard): "10 % utilisation" comes from EN 55022 (and  
260 CISPR 22); if a better wording comes in EN 55022 (or in future EN 55032), it will be taken over in the next  
261 revision of this European Standard >

262

No connection shall be made to any AC mains output port.

263 **9 Measurement methods and procedures for PLC ports**

264 **9.1 Conducted unsymmetrical disturbances**

265 The PLC port of the EUT shall be assessed using an AMN in accordance with EN 55016-1-2:2004, 4.3, the  
266 measurement method given in EN 55022:2010, Clause 9, for the mains ports and the arrangement shown in  
267 Figure 2 below for frequencies between 150 kHz and 30 MHz.

268 The coupling system (see Figure 3) shall

- 269 a) allow the EUT to be exercised by the AE,
- 270 b) have a sufficient loss to ensure signals from the AE do not influence the measurement result,
- 271 c) ensure that the EUT can transmit at its maximum power level.

272 The coupling system is required for

- 273 — providing a defined (symmetric) insertion loss between the EUT and AE,
- 274 — stabilisation of the differential mode impedance,
- 275 — attenuation of the differential mode signal of the AE,
- 276 — isolation of the common mode signal of the AE,
- 277 — filtering of the differential- and common mode signal from the mains.

278 Figure 3 shows an example of a coupling unit with a nominal insertion loss of 40 dB.

279 Measurements in the following operating conditions and configurations shall be performed:

- 280 1) with the PLC modem function of the EUT active and communicating to an associated PLC apparatus  
281 (AE) exercised in accordance with Clause 8, using its maximum transmit power the disturbance levels  
282 shall be measured in the frequency range from 150 kHz to 30 MHz. Above 1,606 5 MHz only the  
283 disturbances within the appropriate excluded frequency ranges need to be compared with the limits;
- 284 2) after completion of step 1, the exchange of user data exercising the EUT shall be terminated. Without  
285 user data transmission, the disturbance levels shall be measured between 150 kHz – 30 MHz.

286

287 NOTE 1 Distance from AE to the reference ground plane (vertical or horizontal) is not critical.

288 NOTE 2 Cable length between EUT and CS is 0,8 m ( $\pm 0,05$  m).

289

**Figure 2 — Test arrangement for measuring the PLC port with an AMN**

290

where

$R = 2,5 \text{ k}\Omega$ ;

$C = 1 \text{ nF}$ .

291

292

**Figure 3 — Example coupling system**

293

294 **9.2 Dynamic power control**

295 The transmitted symmetrical signal from the PLC port of the EUT shall be measured for frequencies between  
 296 1,606 5 MHz and 30 MHz in order to ensure that the maximum transmit signal levels are not exceeded and  
 297 to ensure the presence of a dynamic power control function. The PLC port shall be exercised in accordance  
 298 with the operating conditions given in Clause 8. The measurements shall be made using a peak and an  
 299 average detector; the detectors shall be in accordance with the requirements of EN 55016-1-1 including the  
 300 9 kHz requirement for the 6 dB bandwidth. An example test arrangement is given in Figure 4.

301 The transmit signal level shall be measured at all PLC transmission frequencies, with a symmetrical insertion  
 302 loss between EUT and AE of 10 dB, 20 dB, 40 dB and 50 dB.

303

304 NOTE 1 The insertion power loss between the EUT and the AE is 10 dB to 50 dB adjustable in 10 dB steps.

305 NOTE 2 The insertion power loss between the EUT and the measurement receiver is nominally 20 dB.

306 NOTE 3 The insertion power loss between the signal generator and EUT is nominally 20 dB.

307 NOTE 4 The insertion power loss between the signal generator and the measurement receiver is nominally 6 dB.

308 NOTE 5 The above losses are determined as a part of the test equipment calibration; the actual figures should be used to correct the instrument readings to determine the levels that apply at the EUT terminals.

310 **Figure 4 — Example test equipment arrangement for measuring PLC transmit signal levels**

311

312

313 **Figure 5 — Example schematic of 100 Ω to 50 Ω Balun**

### 314 9.3 Cognitive frequency exclusion

315 Subclause 9.3 provides an option for demonstrating compliance of the EUT with the requirements given in  
 316 6.2 for dynamic frequency exclusion. If cognitive frequency exclusion is selected by the manufacturer, the  
 317 EUT shall comply with the requirements of Annex C when tested using ingress signals in the excluded  
 318 frequency ranges given in Table A.2. The measurement should be carried out using the arrangement given  
 319 in Figure 4 of this European Standard.

320 NOTE Other options are under development.

321 For testing purposes, a radio broadcast service shall also be considered as 'valid' if the conducted signal  
 322 appearing at the PLC port of the EUT in the test setup according to Figure 4 is  $\geq -95$  dBm (in 9 kHz  
 323 resolution bandwidth with an average detector).

### 324 9.4 Conducted asymmetric disturbances

325 The conducted asymmetric disturbances at the PLC port of the EUT shall be measured using the  
 326 arrangement shown in Figure 6.

327 The insertion loss (symmetric) between the two ports of the coupling system shall be such that the link to the  
 328 AE works properly and that the EUT transmits at its maximum power level. Figure 3 shows an example  
 329 coupling system with a nominal insertion loss of 40 dB.

330 The ISN used shall have the characteristics specified in Annex B and shall be bonded directly to the  
 331 reference ground plane.

333 NOTE 1 Distance from EUT to the reference ground plane (vertical or horizontal).

334 NOTE 2 Distance from AE to the reference ground plane is not critical.

335 NOTE 3 In case, the EUT has separate power connection to the mains.

336 NOTE 4 Coupling system (see Figure 3 for details of coupling unit) is required for

- 337 – providing a defined insertion loss between the EUT and AE,
- 338 – stabilisation of the differential mode impedance,
- 339 – attenuation of the differential mode signal of the AE,
- 340 – isolation of the common mode signal of the AE,
- 341 – filtering of the differential- and common mode signal from the mains.

342 **Figure 6 — Test arrangement for measuring the conducted asymmetric disturbances**  
 343 **from the PLC port**

344 **10 Measurement uncertainty**

345 The results of measurements of signals or disturbances from PLC apparatus shall reference the  
346 measurement instrumentation uncertainty considerations where they are contained in EN 55016-4-2.

347 Determining compliance with the limits in this European Standard shall be based on the results of the  
348 compliance measurement, not taking into account measurement instrumentation uncertainty. However, the  
349 measurement uncertainty of the measurement instrumentation and its associated connections between the  
350 various instruments in the measurement chain shall be calculated and both the measurement results and the  
351 calculated uncertainty shall appear in the test report.

352  
353  
354  
355

## Annex A (normative)

### Excluded frequency ranges

356 Where frequency ranges overlap, due to dual use, between Table A.1 and Table A.2 the permanently  
357 excluded range in Table A.1 takes precedence.

358 **Table A.1 — Permanently excluded frequency ranges**

| Excluded frequency range<br>MHz | Service  |
|---------------------------------|--|
| 1,80 – 2,00                     | Amateur Radio Service  |
| 2,85 – 3,025                    | Aeronautical mobile  |
| 3,40 – 4,00                     | Aeronautical mobile (3,40-3,50)<br>Amateur Radio Service (3,50-4,00)       |
| 4,65 – 4,70                     | Aeronautical mobile  |
| 5,25 – 5,45                     | Amateur Radio Service  |
| 5,48 – 5,68                     | Aeronautical mobile  |
| 6,525 – 6,685                   | Aeronautical mobile  |
| 7,00 – 7,30                     | Amateur Radio Service  |
| 8,815 – 8,965                   | Aeronautical mobile  |
| 10,005 – 10,15                  | Aeronautical mobile (10,005-10,10),<br>Amateur Radio Service (10,10-10,15) |
| 11,275 – 11,4                   | Aeronautical mobile  |
| 13,26 – 13,36                   | Aeronautical mobile  |
| 14,00 – 14,35                   | Amateur Radio Service  |
| 17,9 – 17,97                    | Aeronautical mobile  |
| 18,068 – 18,168                 | Amateur Radio Service  |
| 21,00 – 21,45                   | Amateur Radio Service  |
| 21,924 – 22,00                  | Aeronautical mobile  |
| 24,89 – 24,99                   | Amateur Radio Service  |
| 26,96 – 27,41                   | CB radio   |
| 28,00 – 29,7                    | Amateur Radio Service  |

359

360

Table A.2 — Permanent or dynamically excluded frequency ranges

| Excluded frequency range<br>MHz | Service      |
|---------------------------------|--------------|
| 2,30 – 2,498                    | Broadcasting |
| 3,20 – 3,40                     | Broadcasting |
| 3,90 – 4,05                     | Broadcasting |
| 4,75 – 5,11                     | Broadcasting |
| 5,75 – 6,20                     | Broadcasting |
| 7,20 – 7,70                     | Broadcasting |
| 9,30 – 9,95                     | Broadcasting |
| 11,55 – 12,10                   | Broadcasting |
| 13,55 – 13,90                   | Broadcasting |
| 15,05 – 15,85                   | Broadcasting |
| 17,40 – 17,90                   | Broadcasting |
| 18,90 – 19,02                   | Broadcasting |
| 21,45 – 21,85                   | Broadcasting |
| 25,65 – 26,10                   | Broadcasting |

NOTE The bands in Table A.2 include frequency ranges allocated under Article 5 of the ITU Radio Regulations to the Broadcasting Service, plus a realistic appraisal of use for broadcasting under Article 4.4 of the ITU Radio Regulations.

361

362  
363  
364  
365  
366

## Annex B (normative)

### Impedance Stabilisation Network (ISN) for asymmetric disturbance measurements

367 The ISN shall meet the following specifications in the frequency range of 1,606 5 MHz to 30 MHz:

- 368 — the common mode termination impedance at the EUT port shall be  $25 \Omega \pm 3 \Omega$ , phase angle  $0^\circ \pm 25^\circ$ ;
- 369 — the differential mode impedance of the EUT port with the CS port terminated with  $100 \Omega \pm 1 \%$  shall be  
370  $100 \Omega \pm 10 \Omega$ , phase angle  $0^\circ \pm 25^\circ$ ;
- 371 — the decoupling attenuation (common mode isolation of the ISN excluding the Coupling System) between  
372 CS port and the ISN voltage port shall be:

$$373 \quad a_{\text{CISN}} = 20 \log (E_{\text{CISN}} / 2 * V_{\text{CISN}}) \geq 55 \text{ dB minus Voltage Division factor}$$

374 NOTE 1 The Voltage Division factor, as defined in EN 55016-1-2, is normally a negative figure, thus it normally  
375 increases the required  $a_{\text{CISN}}$ .

376 NOTE 2 The measurement arrangement for the common mode isolation  $a_{\text{CISN}}$  is shown in Figure B.2.

- 377 — the longitudinal conversion loss (LCL) of the ISN measured at the EUT port with the CS port terminated  
378 with  $100 \Omega \pm 1 \%$  shall be  $\geq 55$  dB;
- 379 — the attenuation distortion or other deterioration of the quality of signal quality in the wanted signal  
380 frequency band caused by the presence of the ISN shall not affect the normal operation of the EUT;

381 An example of a schematic diagram of an ISN is shown in Figure B.1.

382

393

## Annex C (informative)

### Cognitive frequency exclusion

394 NOTE Annex C is derived from the relevant parts of ETSI TS 102 578 V1.2.1 (2008-08).

#### 395 C.1 Abbreviations

396 For the purposes of Annex C, the following abbreviations apply.

397 AM Amplitude Modulation

398 DRM Digital Radio Mondiale (See ETSI ES 201 980 or <http://www.drm.org/>)

#### 399 C.2 PLC apparatus broadcast radio detection

##### 400 C.2.1 Overview

401 Signals from radio broadcast stations ingress onto the AC mains power network of homes. These ingress  
402 signals can be detected by PLC modems by comparing the ingress signal level at the PLC port with the  
403 noise floor.

##### 404 C.2.2 Noise floor

405 The noise floor shall be measured by the PLC modem at adjacent frequencies lower and higher than the  
406 broadcast radio bands given in Table A.2. The adjacent frequency block to be monitored shall be as wide as  
407 the radio band allocation itself. The adjacent frequency blocks shall be completely monitored by the PLC  
408 modems without any gaps. The noise floor is the median value of all measured values of the electrical  
409 energy in the adjacent frequency blocks on the power line channel excluding all power line communication  
410 signals. An individual noise floor level shall be calculated for each broadcast radio band. The frequency  
411 locations and resolution bandwidth of the measured values is dependent on the PLC modem  
412 implementation.

413 A short impulsive noise e.g. caused by a light switch shall not influence the noise floor measurement.

##### 414 C.2.3 Levels and thresholds

415 Signal ingress shall be identified as a receivable radio broadcast service if the signal is at least:

416 Criterion (1): 14 dB above the noise floor

417 If criterion (1) is satisfied, the threshold level of ingress of a broadcast signal identified as receivable is:

418 Criterion (2):  $\geq -95$  dBm (9 kHz Resolution Bandwidth, AV)

419 Additionally PLC modems may limit the identification of a receivable radio broadcast service to such signals  
420 that are AM or DRM modulated including very low AM modulated signals (plain carrier or a silent period).

421 The noise floor and broadcast radio signal shall be measured between the live and neutral conductor at the  
422 socket to which the PLC modem is connected. The measurement shall be made using a spectrum analyser  
423 or measurement receiver specified and adjusted as in EN 55016-1-1:2010, Clause 6.

424 The threshold is defined to take into account the sensitivity of broadcast radio receivers and reception factor  
425 between the field and the signals on the mains. The measurement bandwidth and detectors specified here  
426 are for verification of the implementation of the present document, which is described in detail in C.3.2.  
427 Resolution bandwidth and detectors used by the PLC modem are implementation dependent.

428 Taking into account the fading effects defined in ITU-R Recommendation BS.1615 and the robustness of  
429 radio receivers ETSI ES 201 980, the signal is considered to be present if criteria (1) and (2) are exceeded  
430 for at least 30 % of time in any 10 s interval.

### 431 **C.3 Verification of the cognitive frequency exclusion implementation**

#### 432 **C.3.1 Measurement arrangement**

433 The implementations of cognitive frequency exclusion shall be verified using the measurement apparatus  
434 and arrangement shown in Figure 4.

#### 435 **C.3.2 Spectrum Analyser Settings**

436 The spectrum analyser shall be configured as follows:

437 Centre frequency: Carrier frequency of signal ingress

438 Frequency span: 200 kHz

439 Resolution bandwidth: 300 Hz

440 Video bandwidth: 3 kHz

441 Detector: Average or peak

#### 442 **C.3.3 Artificial Signal Ingress**

443 Signal ingress shall be one or several signals at various frequencies of

444 — AM-Radio: modulated with a 1 kHz sine wave, 30 % modulation depth, or

445 — DRM: ETSI ES 201 980.

446 The strength of individual signals shall be equal to or higher than the level defined in C.3.4.

#### 447 **C.3.4 Levels and thresholds at verification-bench**

##### 448 **C.3.4.1 Level of signal ingress**

449 Using the arrangement shown in Figure 4 and the settings defined in C.3.2, the thresholds given in C.2.3 are  
450 verified by integrating the energy of the measured frequency points to a measurement bandwidth of 9 kHz  
451 (according to EN 55016-1-1:2010). Usually, spectrum analysers have a built-in function to do this. The  
452 attenuation of the measurement apparatus shall be added to the values from criterion (2).

453 The level of individual artificial signal ingress shall exceed these thresholds to enable a PLC modem to  
454 cognitively exclude these frequencies.

455 **C.3.4.2 Lower level of the excluded frequency range**

456 The lower level of the excluded frequency range shall be measured with the spectrum analyser configured in  
 457 accordance with C.3.2. The measured Average level shall be less than - 89 dBm (see Note below for further  
 458 detail on this value).

459 NOTE The lower level of the excluded frequency range is derived from EN 55022:2010 Class B mains conducted  
 460 disturbance limit (5 MHz to 30 MHz) which is  $U_{AMN} = 50 \text{ dB}(\mu\text{V})$  (resolution bandwidth 9 kHz, AV)

461 For verification of the mains port limits, an AMN (artificial mains network, specified in EN 55016-1-1) is used. It measures  
 462 half of the differentially fed voltage at the measurement output. It follows that at the outlet  $U_{outlet}$  where the PLT modem is  
 463 connected, twice the differential voltage is present.

$$464 \quad U_{outlet} = U_{AMN} \cdot 2 = 50 \text{ dB}(\mu\text{V}) + 6 \text{ dB} = 56 \text{ dB}(\mu\text{V})$$

465 Conversion from dB( $\mu\text{V}$ ) to dBm, using  $Z = 100 \Omega$  conversion factor of 110 dB(mW/ $\mu\text{V}$ ):

$$466 \quad P_{outlet} = 56 \text{ dB}(\mu\text{V}) - 110 \text{ dB(mW}/\mu\text{V}) = - 54 \text{ dBm}$$

467  $P_{outlet}$  of PLT modem at lower level of the excluded frequency range converting it to 300 Hz as specified in C.3.2:

$$468 \quad P_{outlet} = -54 \text{ dBm} - 10 * \log_{10}\left(\frac{9 \text{ kHz}}{300 \text{ Hz}}\right)$$

$$= - 54 \text{ dBm} - 14,7 \text{ dB} = - 68,7 \text{ dBm}$$

469 Considering the 20 dB attenuation of the measurement apparatus shown in Figure 4 the value displayed on the spectrum  
 470 analyser should be

$$471 \quad P_{displayed} = - 68,78 \text{ dBm} - 20 \text{ dB} = - 88,78 \text{ dBm} \text{ (rounded to } - 89 \text{ dBm)}$$

472 **C.3.5 Test procedure**

473 The PLC system shall transport maximum payload as a continuous transmission. The following test  
 474 sequence shall be performed.

475 Prepare the artificial ingress signal with 20 individual signals within the frequency ranges defined in  
 476 Table A.2 and the communication spectrum of the EUT. The signal level of each individual ingress signal  
 477 shall be as defined in C.3.4.1. A test signal is defined in C.4.

478 Tune the spectrum analyser to the centre frequency of the 1<sup>st</sup> artificial ingress signal.

479 Switch the artificial signal ingress on.

480 Monitor the spectrum analyser to confirm that the PLC signal is excluded and measure the excluded  
 481 frequency range to ensure it complies with the requirements defined in 6.2.

482 Tune to all other frequencies where an artificial ingress signal is located.

483 Switch the artificial ingress signal off and monitor the spectrum analyser, to confirm that the PLC signal is not  
 484 reused within the time specified in 6.2.

485 **C.4 Test signals**

486 A file containing a definition of a suitable test signal is available from  
487 [http://pda.etsi.org/exchangefolder/ts\\_102578v010201p0.zip](http://pda.etsi.org/exchangefolder/ts_102578v010201p0.zip)

488 The test signal modulates 20 individual signals within the HF broadcasting bands:

489 a) 10 AM signals generated at the following frequencies:

490 4,75 MHz, 5,9 MHz, 7,2MHz, 11,6 MHz, 11,62 MHz, 11,65 MHz, 11,69 MHz, 15,1 MHz, 21,45 MHz,  
491 25,67 MHz.

492 b) 10 DRM signals generated at the following frequencies:

493 4,89 MHz, 6,2 MHz, 7,45 MHz, 11,61 MHz, 11,63 MHz, 11,66 MHz, 12,1 MHz, 15,8 MHz, 21,85 MHz,  
494 26,1 MHz.

495 AM and DRM signals alternate in the frequency domain.

496 Frequencies are chosen to be located close to the margins of the HF broadcasting bands. They are slightly  
497 modified to fit into a carrier spacing of 5 kHz and an integer number of wavelengths of the carrier frequency  
498 that needs to fit into the total signal length.

499 A group of 4 adjacent carriers should be generated (11,6 MHz, 11,61 MHz, 11,62 MHz, 11,63 MHz), one gap  
500 (11,64 MHz), 2 more carriers (11,65 MHz, 11,66 MHz), 2 gaps (11,67 MHz, 11,68 MHz) and one more  
501 carrier (11,69 MHz).

502 The sampling frequency is 80 MHz. Total signal length is 2 133 760 samples (26,7 ms).

503  
504  
505  
506

**Annex ZZ**  
(informative)

**Coverage of Essential Requirements of EU Directives**

507 This European Standard has been prepared under a mandate given to CENELEC by the European  
508 Commission and the European Free Trade Association and within its scope the standard covers the  
509 essential requirements as given in Article 1(a) of Annex I of Directive 2004/108/EC and the essential  
510 requirements of Article 3.1(b) (emission only) of Directive 1999/5/EC.

511 Compliance with this standard provides one means of conformity with the specified essential requirements of  
512 the Directives concerned.

513 **WARNING:** Other requirements and other EU Directives may be applicable to the products falling within the  
514 scope of this standard.
